Today's applications are marvels of distributed systems development. Each function or service that makes up an application may be executing on a different system, based upon a different system architecture, that is housed in a different geographical location, and written in a different computer language. Components of today's applications might be hosted on a powerful system carried in the owner's pocket and communicating with application components or services that are replicated in ...

George Coulouris: Personal Home Page

Distributed computing is a field of computer science that studies distributed systems. A distributed system is a system whose components are located on different networked computers, which communicate and coordinate their actions by passing messages to one another. The components interact with one another in order to achieve a common goal.

Operating Systems Notes

Data replication is a common technique for programming distributed systems, and is often important to achieve performance or reliability goals. Unfortunately, the replication of data can compromise its consistency, and thereby break programs that are unaware. In particular, in weakly consistent systems, programmers must assume some responsibility to properly deal with queries that return stale
